you could put some sve cod ein the before close event of the the work book that saves it to the network drive.... USting user and date and filename.
Only word of caution....is these users always connected to this network drive?

Greetings:

I am hoping someone will help me out with a problem that I am currently having.

Users all share a common spreadsheet that I have created. I have placed this spreadsheet in their own sub directory on our server (windows server 2000). I would like the ability to automatically have them save this file, after they have made their changes, into a different directory on the server. We are all running Excel 2003. This is a quote form that the users create for our customers. When finished, they either save the form (replacing my template), or save it somewhere where later they can't find it. Secondly, our customer service people also need to reference this quote form. Having a directory where all of these individual quote forms saved would help us out tremendously. As easy as it is, they just cant seem to be able to work with the "save as" function. I know, it's frustrating....

Any ideas?

Thanks for your help!

Mark
