Hi all, I have a worksheet filled with students information (ID,name, nationality.. etc.) and we are requested to give a print outs of students with any information missing from his record, so my plan is to create a macro that do the following:

- loop throug every row until it reachs the end of the worksheet
- in each loop it will check if any of the cells is empty
- if one of the cells is empty it will copy this row to a new sheet and then start at the beginning of the next row then continue the loop
- if none of the cells is empty (no information is missing) then go to the beginning of the next row then continue the loop.

this is what I came up with:

```
Dim tmp As Integer
Do Until IsEmpty(ActiveCell)
For I = 1 To 11 ' 11 columns in each row that I have to check
Do While bolFlagged = True
If ActiveCell.Value = Empty Then
sheet2nextcell ' a function that copies the
current row to another sheet
bolFlagged = False ' I used this variable for
students not to dublicate
GoTo ExitLoop
End If
ActiveCell.Offset(0, 1).Select
Loop
ExitLoop:
Next I
Cells(ActiveWindow.RangeSelection.Row, 1).Select 'first cell
in current row
ActiveCell.Offset(1, 0).Select
```

as you may see this code isn't correct at all because I am no programmer I can't figure out what I am doing wrong, so any input

Copy row with an empty cell for each row in a sheet

would be appreciated.
