Hmm! I have been answering your questions here in this group while you are running it over in m.p.e.worksheet.functions also. Something for you to consider for the future...

From a post by Jeff Johnson:

"You have posted this question individually to multiple groups. This is called Multiposting and it's BAD. Replies made in one group will not be visible in the other groups, which may cause multiple people to respond to your question with the same answer because they didn't know someone else had already done it. This is a waste of time.

If you MUST post your message to multiple groups, post a single message and select all the groups (or type their names manually in the Newsgroups field, separated by commas) in which you want it to be seen. This is called Crossposting and when used properly it is GOOD."

Some additional comment previously posted by me:

"You may not see this as a problem, but those of us who volunteer answering questions on newsgroups do see it as a problem. You can't imagine how annoying it is for a volunteer to read a question, research background material, test sample code and then formulate and post an answer to the original question only to go to another newsgroup and find the question posted and ALREADY answered over there. On top of that, if you cross-post your question, all of the readers in all the newsgroups it is cross-posted to get to see both the original question and all of the answers given to it. This is beneficial to you because then we can add additional material to, add clarification to, as well as add additional examples to an answer you have received previously... that means you end up with a more complete solution to your problem. This is a win-win situation for all of us."

Rick
