

Macro linking to wrong workbook

Source: <http://www.tech-archive.net/Archive/Excel/microsoft.public.excel.misc/2007-08/msg03870.html>

I have a monthly process where each month I get a new report. In order to calculate the numbers I need, I open the prior month file and copy the tabs lookups / pivots I need.

I have macros stored within those tabs to update the pivots and run selected filters.

In order to run the pivots, I created command buttons on the pivot tab assigned to run each macro.

The issue I am having is once I move the tabs into the new workbook, the command buttons try to run the macros from the prior month file and not the current month file.

I know how to correct this by reassigning the buttons but it's annoying to have to do this every month.

Any suggestions on how to have the buttons simply refer to the macros in the current workbook? One other complication, other people use this file as well so I cannot store the macros in my personal macro workbook since they won't be able to access them.

(If it matters at all, the macros are actually stored within the sheet as opposed to a module in the workbook).
