

Creating worksheets based on lines of information from another worksheet

I'm basically trying to create a database in a single excel file. My first worksheet contains lines of information – each line contains a single project with different points of information in each column.

What I want to do is for the excel file to automatically create a new worksheet for each line of information, filling in all the information accordingly in an outline fashion.

So for instance, if I have 5 project, 5 lines – I should have 5 worksheets, one for each line, each project. All the sheets following the initial "list" worksheet will be of the same format – so if perhaps its easier to make some sort of "form skeleton" and have excel fill in the data accordingly, that would work too.

Any help would be greatly appreciated! Thanks!
