Sorry about the cross post. Just discovered this group.

The code below is suppose to print a worksheet, but my problem is that it is suppose to print to a specific network printer and that printer is not always assigned to Ne09. I have seen it be anything from Ne01 to Ne10.

Any way this code can be forced to look for the proper Ne##?. Unfortunately, depending on the computer from which this is run, it is not normally the default printer.

This is just a snippet of the code. The macro is much more involved

```
Sub Macro7()  
,  
' Macro7 Macro  
' Macro recorded 8/28/2008 by wta  
,  
,  
Application.ActivePrinter = "\\printserver1\ParaT_HPLJ_3800 on Ne09:"  
ActiveWindow.SelectedSheets.PrintOut Copies:=1, ActivePrinter:= _  
"\\printserver1\ParaT_HPLJ_3800 on Ne09:", Collate:=True  
  
End Sub
```
