Well, they're a good idea to have running if you have a publicly-accessible IIS machine. They are designed to stop certain URL-based attacks and prevent certain types of files from executing on the server. I was just checking because they can cause unexpected results with certain scripts/file types. I doubt this is the case here since you didn't install them.

No problem – just checking. <g>

Yes. You may want to try your luck in one of the ASP or IIS groups to see if anyone knows what's going on. Sorry I couldn't be of more assistance.
