i am running simulation analysis. Each simulation returns results comes in cells b60 to b85 of sheet2. next simulation will also return its output in the same range.

suppose i am running 10 simulations. each simulation output is basically a 10 rows by 1 column range in sheet2. this results need to go into an array called FinalOutput which would be a 26 by 10 array. I want to read the entire range "b60 to b85" in sheet2 into the FinalOutput array. Basically depending on the simulation number, an entire column of FinalOutput array gets created. so simulation 1 output gets transferred to column 1 of final output array and so on. is there some way i can transfer an entire range into a column of an array.

thanks pradip

??? Where is the FinalOutput array between simulations?
