Looks you are right there.

I thought there was a way to alter the color of the circle itself, but can't see it now.

Maybe you could simulate option buttons with small text boxes.

Hi Bob and RB Smissaert  
Backcolor only addresses the area surrounding the click area,  
in other words  
where the text for the control is, as far as i can tell.  
Please tell me if i  
am wrong. I am trying to address the area where the black  
point or tick  
appears when clicked.

If you use controls from the Control Toolbox you can set the backcolor property
