There is no command line option in excel that will allow you to do this but you shouldn't need to. How are you creating the new workbooks? I assume you will do it programmatically from another workbook that you're working from? If so then you can do whatever you need to do to this newly created file from that workbook; even have it write the module to your new file. Would probably need some more information on what you are trying to do so if you can explain in more detail then I may have some example code to help you.
