Using this code to save when the file already exists...

```
Logfile = "filename.xls"  
Application.DisplayAlerts = False  
ActiveWorkbook.SaveAs Filename:=CurDir() & "\" & Logfile,  
ConflictResolution:=xlLocalSessionChanges  
Application.DisplayAlerts = True
```

How do you know which default (yes/no) is taken to the overwrite message?  
I assume from all the posts I have seen on this topic that the "yes" default  
is taken, but what if you wanted the "no" option taken?

The parm for "ConflictResolution" seems like that should handle it, but the  
options shown in the help files do not cover this.
