I'm trying use Excel's Data Validation with a custom validation formula, but the formula length is limited to 255 characters.

In order to use a longer formula, I've implemented a validation function in VBA. I can call this function from a cell, but when I try using it in Excel's custom validation formula, it thinks the function is a named range.

Is there any fix for this short of implementing validation completely on my own?

-David
