I am having "string path problems" when porting an add-in to different xp machines (This works fine on my XP development machine). See a reference to the problem here:

<http://www.exceltip.com/book-1931841047.html>

Is there a way around this problem using code so that my users don't have to copy all of the sheets to a new workbook in Windows XP in order to make the VBA string functions work properly?

.
