I think we're talking at crossed purposes here. I was wanting to make the SOURCE ranges named, such that if I had to add something to the range, it wouldn't mean me having to rewrite a lot of code to go with it.

In other words (using the example I gave), Intra_mA is currently a range on Lookup as defined in the Set line, but I wanted it to be a named range so that if for example I needed to add an extra row, I could do that on Lookup and redefine the named range, rather than having to go into the code.

More importantly it would mean that the ranges below Intra_mA in Lookup would automatically update.
