Hi All

Have been using Excel to generate custom reports on data from remote databases quite happily.

I now have a need to avoid making lots of calls to the DB by downloading the complete table concerned and using a rsABC.Filter in a loop to do a different multi-column FIND in each iteration to get the various records I need.

However any statement as 'rsABC.Filter "..."' throws a compile error 'Invalid Use of property' with the '.Filter' highlighted.

Any suggestions as to what I am missing will be much appreciated.

TIA

Dash
