If you are talking about updating links, in xl2002 and earlier, you can either have the links update with no prompt or be prompted. Code doesn't run before the question is asked and if you are opening the workbook with code from another workbook, I don't believe displayalerts will suppress this – however in that situation, you can just use the UpdateLinks argument in the workbook.Open command to suppress it.

In Excel 2003 there is an option under Edit=>Links to suppress it.

(I could be misremembering, but I don't believe this option was added until 2003. If it was any earlier, it was xl2002, but I believe not).
