

RE: Macro Virus?

and opened the workbook (I test the app in both versions of excel). I now get this excel error message no mater how I try to open the file...

"The macros in this file do not match the digital signature. Only a macro virus would cause this. Please scan for viruses, and notify the publisher of this document. Macros will be disabled."

* Ok I am the publisher... so I notified myself!

* The PC I was working on is the one that I have added my own self signing certificate with SELFCERT.EXE So all saves of any macro changes should keep the current certificate. OS is Win2000 (5.00.2195 Service Pack 4 with Automatic updates turned on)

* I have spent the last 4 hours messing with my eTrust AntiVirus software. I did update the virus "signature" file and when I scanned the XLS file it reported nothing was wrong. I then scanned both my fixed drives 3 times. The 1st time 3 infected files were reported. 1 was cleaned ok, the other 2 were Java applets in the cache that after a lot of research I found out how to delete those files. The last scan reports all is clean now.

I still can't get my VBA code enabled. I have looked through the code modules and forms-code and all looks like my code, no malware that I could find. (Could there be malicious code still hiding somewhere in my VBA project or the XLS file?)

What do I do to solve this problem?

The virus' that were found were: Win32/SillyDI.OE (which was cleaned by the software) and Java/ByteVerify!exploit (which would not clean, I had to manually delete the java cache files, then the next scan reported all was clean) I noticed that each of these 3 virus was detected by using what eTrust Antivirus called "Signature" I dont know if that is related to the "digital certificate" that I am using to sign my VBA projects.
