Hi,

I'm trying to test to see if a string exists in a range.

foundmatch = Application.WorksheetFunction.Match("wjv",

Range("staff").Value, 0)

works if range staff is a single column or row, if the range is a matrix it  
returns 0

I tried useing

foundcount =

Application.WorksheetFunction.CountIf(Range("group\_code").Value, "WVJ")

where group\_code is more than a single row or column, it also returns 0.

Any ideas would be greatly appreciated.

peter
