That's a question you should be asking in a SQL Server newsgroup.

Hi,

I'm using SQL Server 2005.

I would like to allow remote (unidentified) users to only see Views in the Excel ODBC Connection window.

At the moment, when a user opens the Excel ODBC connection window, it displays all the objects: master DB, TempDB .... with all the tables, views...

How to manage permissions/roles (I'm a bit confused with all that)...etc.... to see only the objects I would like to appear?

Thanks,

Chrisotphe
