Hi Bodhisatvaofboogie,

Try:

Application.EnableAlerts = False

'Your closing code

Application.EnableAlerts = True

Regards,
Norman

I have two possible requests, which ever is easiest will be the best choice.

:)

A macro I'm working on opens up extra work books for the purpose of pasting various filtered data (it's fairly complicated, was the only way I could think to extract the data exactly how I wanted). The end resulting workbook is the keeper, everything else I want to have close. SO Here is what I've been playing with:

```
Windows("Book1").Activate
ActiveWorkbook.Close savechanges:=False
Cells.Select
Selection.Copy
ActiveWindow.Close savechanges:=False
Cells.Select
```

Re: Closing Workbooks

ActiveSheet.Paste

The only problem with this is that two caution windows pop up. It would be nice if the macro could just auto answer and I wouldn't have to pay attention to it.

1: Asking do you want to save the information copied on the clipboard for pasting later

What does the code look like for it to auto answer yes to that question?

2: Asks do you want to paste anyway? The data being pasted is a different size.

What does the code look like for it to auto answer yes to that question?

That would solve everything, leaving a single workbook open. BUT if there is an easier way, perhaps a formula that will close everything EXCEPT for the last one (in this case "Book2") That just seems like it would be simpler, but I haven't the foggiest what the code would look like. Any ideas???

THANKS!!!
