Scott,

By "the code will execute in debug mode without errors", you mean in the VB6 IDE ?

And in Excel, you set a reference to the DLL ?
Instantiate the object ?

A bit more info the error/not working may help us.

If anyone can help me, I will be very appreciative.

I've written an ActiveX DLL that has mysteriously stopped working on my development machine but works fine on another test machine. Each machine

has

the same version of Excel (i.e. 2003) and is running the same dll and xls file. However, on the development machine, the code will execute in debug mode without errors (reference made to vbp file vs dll). I have tried a

lot

of things to resolve the issue: OS LiveUpdate, Office Update, delete dll

from

registry, register / unregister dll via regsvr32, checked dll using Dependency Walker, etc but nothing has helped. Ideas anyone? Thanks!
