bob,

Thanks for the feed back, but please re-read the post.

I already knew that this syntax is incorrect (I stated that in the comments). I intentionally had that in there to trigger a legitimate error. That is not where the problem lies. When I have this incorrect syntax in the code, the error handler works correctly, BUT when I use [Ctrl] + [Break], the error handler does not work correctly.

Any more thoughts on the matter will be greatly appreciated,

Conan

Hello all,

Using Excel 2002 (10.6501.6626) SP3

Re: Help with Error Handlers!!!

BUT with the following code AND INTERRUPTING EXECUTION WITH [Ctrl] +

[Break], the error handler does not work correctly. Instead, I

get this error message:

http://home.att.net/~ctbarbarin/files/progress_error.jpg

```
Sub PasteReplaceNulls()  
On Error GoTo PasteReplaceNulls_Err
```

```
Application.EnableCancelKey = xlErrorHandler
```

```
'Statements that will cause the macro to run for a long time,
```

hence the need for "Application.EnableCancelKey =

```
xlErrorHandler" above
```

```
PasteReplaceNulls_Err:  
MsgBox ActiveWorkbook.Name & vbCrLf & ActiveSheet.Name & vbCrLf  
&
```

```
Selection.Address
```

```
Exit Sub
```

```
End Sub
```

How can I get this to work correctly when I interrupt execution with

[Ctrl] + [Break]?

—

Thanks for any help anyone can provide,

Conan Kelly
