Ok thanks, think I get it now.

Your Sub is coming up with a 0 in Word..

```
Sub tester()  
MsgBox wdPrintAllDocument  
End Sub
```

```
Thanks for that.  
For the line;  
wdApp.Selection.PageSetup.TopMargin = appwd.CentimetersToPoints(4.8)  
It is saying an Object is required. How do I get round this? Dim  
whatever as Object??? I'm guessing...
```

```
I'm also having problems with the lines;  
wdApp.Selection.MoveUp Unit:=wdLine, Count:=2, Extend:=wdExtend  
wdApp.Selection.HomeKey Unit:=wdLine, Extend:=wdExtend
```

```
And the following line is saying the number needs to be between -32765  
& 32767;  
wdApp.Application.PrintOut Filename:="", Range:=wdPrintAllDocument,  
Item:= _
```

Re: Late Binding Help please

```
wdPrintDocumentContent, Copies:=1, Pages:="",  
PageType:=wdPrintAllPages, _  
ManualDuplexPrint:=False, Collate:=True, Background:=True,  
PrintToFile:= _  
False, PrintZoomColumn:=0, PrintZoomRow:=0,  
PrintZoomPaperWidth:=0, _  
PrintZoomPaperHeight:=0
```

Thanks
Tony

Hi,
I'm having a problem with a couple of lines
of my code which I need to
change. I'm no programmer, so I don't really
understand all this early/
late binding stuff..

I do know that I need to use late binding
though, as I have a file
which is used by users with different Office
versions..

My code is coming up with an error on lines;

```
wdApp.Selection.EndKey Unit:=wdStory  
&  
wdApp.Selection.PageSetup.TopMargin =  
CentimetersToPoints(4.8)
```

Re: Late Binding Help please

How can I fix this?

Cheers
Tony

A number of problems – firstly, WdStory is a Word constant, not a global one – it's value is 6. Secondly, the := method doesn't work outside of the host application – so the first version should be

```
wdApp.Selection.EndKey 6
```

The second one uses a Word command in the form of CentimetersToPoints so should be expressed as...

```
WdApp.Selection.PageSetup.TopMargin =  
appwd.CentimetersToPoints(4.8)– Hide quoted text –
```

– Show quoted text — Hide quoted text –

– Show quoted text –

Sorry, I'm half asleep I think – replace AppWd with WdApp (I used my standard word object name instead of your variable)

For Range:=wdPrintAllDocument refer to my comments about := and about Word Constants – to find out the value of any Word constant, go to Word's VBA and create a sub routine along these lines

```
sub tester  
msgbox wdPrintAllDocument
```

Re: Late Binding Help please

end sub

Running this will give you the numeric equivalent of the constatn– Hide quoted text –
