Did you attach a combo box to your worksheet?
Which excel version are you using?

I attached it directly to my worksheet and it worked in conjunction with a
data validation within the column.

That is my question I basically want a change event code that will copy the
state abbreviation to the database when the user selects the full state name.

I'm not clear. How did you use it in your database column?

Also, what is the code of the combo box _change event?

I have a userform with a series of textboxes and one
combobox set to dropdown
a list of the 50 states. That works just fine, however I would
like it to
when the user selects say Alabama from the dropdown and
clicks the 'ADD'
button the value entered in to the database to be its
abbreviation 'AL' not
the full name. Now I have used this code within my database
column but I
would like it to apply to the combobox and I am not sure
how to do it?

Re: Help with the following code??

```
If Target.Cells.Count > 1 Then Exit Sub
If Target.Column = 5 Then
If Target.Value = "" Then Exit Sub
Application.EnableEvents = False
Target.Value = Worksheets("Lists").Range("A1") _
.Offset(Application.WorksheetFunction _
.Match(Target.Value,
Worksheets("Lists").Range("StateName"), 0), 0)
Application.EnableEvents = True
End If
```
