Hi,

Using Excel 2000

I have spreadsheet that uses text entries to do a Vlookup, the look up range has text in the format of 6 characters albeit they look like numbers with leading zeros eg. '000100. The entry that I enter if '000100 returns the correct result. However, when others enter they tend to just enter '100 which doesn't match. I therefore thought that if I could check the length of their entry, I could fill with leading zeros to make it 6 characters long.

Having tried to do this with validation, I'm now thinking this is a change cell piece of code.

Any pointers of sample code would be appreciated.

Thank you, Rob
