Did you try either of what Dave posted? If you look carefully at the second one, you will see a semi-colon after the Print statement argument... that tells the Print statement to suppress the line feed (actually, it is a carriage return followed by a line feed the Print added to your output and it is this combination that the semi-colon suppresses). By the way, this is covered in the help files for the Print# Statement (which I am guessing you didn't read).

No silly.

Is there a way to tell Print not to add the line feed?

```
Sub Write2()  
Open "C:\output.txt" For Output As #1  
Print #1, "hello world"  
Close #1  
End Sub
```

or maybe...

```
Sub Write2()  
Open "C:\output.txt" For Output As #1  
Print #1, "hello";  
Print #1, " world";  
Close #1  
End Sub
```
