Great thanks.

Now that gives me the value. I need to now find the corresponding Names

for

example  
Column A Column B  
Jas 1500  
Peter 1200

For the value I want to be able to get the value in column A.

Now the vlookup is not going to work in this instance as the spreadsheet

for

a business reason cannot be sorted on Column B.

Any other ideas?

Look at the SMALL() and LARGE() worksheet functions.

I want to be able to do a report from a single worksheet  
which will

show

The top 10 items  
Bottom 10 items

I can use autofilter but autofilter only does one at a time and  
does it  
in  
the worksheet itself.

I want to be able to show the top and bottom 10 on a separate  
list.

Any ideas how this can be done.

Thanks
