Take a look here to find out how to use the Workbook_BeforePrint event.

Hi,

I would like assistance to write a macro which creates a page center to read from column data. I would like for example the text string to read "Wasuto updates for Supervisor ?? data date ??. Wasuto would be placed if column 4 has "WAS" in the 12 character text (example:45WAS51302U35) or if "KEM" is there instead I'd like the word "Kematsa" instead. Also I'd like the Supervisor's name if column 5 lists his name greater than 50% of the time. There could be up to 25 different Supervisors names. Lastly I'd like the current date behind the word date in the string. I'm using excel 2003. There could be up to 5000 rows of data. The first row is the header row. Any help would be greatly appreciated.
