I have another code that does that same thing. But what I can't get it to do; is delete the second 2 from column "J". In other-words, I need column "J" to have only the far left remaining.

If column "J" has "ABC1" in a string, final result should be: Column "J" = "AB" and column "L" = "C1".

AND sometimes column "J" will have a 5 character string like "ABCD1".

And then I still want column "L" to only have "D1" and column "J" = "ABC" in final result.

I probably need to add another command to it.....

What do you think?
