Thanks Dave for the reply, both to my query and for the info about various log-ins here. I will be checking them out soon.

My first post still hasn't shown up here.

I'll look at the .savecopyas and kill function, however as I was trying to avoid saving file to disk, this probably won't do what I'd like here. A bit more explanation may be helpful here...I've got a WB with multiple sheets, one sheet gathers data from another sheet in that WB and then is copied to a new WB...then with some manipulation, I kill the links and sort the data. It's at this point (WB is named "Book1" by default), that I'd like to change the WB name without saving so as to have the file name as a header, but if I'm reading you correctly, I guess that's impossible, even with VBA. I can just go the direction I've been going and print a draft, then save file and then print a final doc.

Thanks again for the second reply....still not sure why my first post isn't showing here.....but....at least I got a response....you guys and gals are great.

Have a great day,

Don
