I have a spreadsheet that I started and someone else finished. It performs calculations and works fabulously, but, on my spreadsheet my first column (column A) is my "Sold" price and in column B, the "cost" price. I need to switch columns and make column A the "Cost" column and column B the "Sold" column. The columns are formatted somehow down to line 100 with its "function" jobs to where all I have to do is put in the sold and cost prices and it will calculate how much the salespeople made, the manager made, the buyer and the senior buyer also made. How can I switch the columns and still get all my columns to calculate properly. Thanks very much in advance for any and all help.

.
