first off thanks you guys for taking the time to help. i have got alot of info from the forums. ok here is my latest adventure! i am trying to create a list of phone numbers for my boss. he asked me to pull out every phone number on his phone bills and make a list using excel. now his bills are in PDF formatt and i have purchased a PDF to excel converter and it works great, my issue is once im in excel i want to extract or copy all the phone numbers, is that possible? so far ive just been able to delete alot of unwanted text and conctect that carries over from the PDF and narrow it down to only 2 colums (A and B) but there is still a few things i dont need like text that reads "incomig" ect and ive been deleting row by row and sometimes there are 1200+ rows and thats just taking way to much time. im thinking there has to be a way that once i have all the data in excel i can just copy all the phone numbers in the doc? im using office pro 03, can someone help this girl out? thanks

.
