G'Day,

Ive got a problem Ive been working on for about 6 months and need a hand cause I cant think anymore!

Ive got 7 columns, with about 400 rows of data which increases on a daily basis. In the first row (A) I have the dates that I have worked and in the remaining columns I have the type of work that was done, so for example:

A	B	C	D	E	F				
G	Date	Day	Night	Day	Twin	Night	Twin	Turbo	Jet
	19/01/07	1.0							
	20/01/07	3.5							
	21/01/07								
	9								
	..								
	..								
	..								
	21/02/07	5							

What I need is a formula that will automatically go back and look through the dates (column A) and pick out all the ones that would be included from today back by 30 days (so today()-30). Then from that I need it to add all the times from those days only.

Ive tried SUM, SUMIF, IF and cannot figure it out, maybe too advanced for a formula. A friend of mine played around with a macro for me, but it does not update automatically and requires reprogramming for each new row created.

This is the last component in a project Ive been working on for personal use for about 2 years and Id love to get it over with! PLEASE HELP!!!!!!!

.
