My apologies if I sounded glib; that was not my intent. I was simply trying to reflect that it did not matter to me where a response originated.

And, I was not aware of any protocol that required posting only in one group.

I will be better informed in the future.

I posted it in both, since I was not sure where I would find someone with an answer. I do not care where I receive an answer, as long as I get one.

Thanks

Don

I am trying to build a worksheet to help
create schedule assignments.

Columns show the date, and the people
being assigned are list in Column

A.

I

have set up data validation, so that people
can only be assigned to
specific

tasks, found in the list source. However, I
want to ensure that only

one

person is assigned to any one task in the list.

Later, I will also

want

to

set up a protocol to make sure that someone
is in fact assigned to

every

task.

Any suggesdtions on the best way to achieve
this?

Thanks
