Each post to the newsgroup is archived in google. If you explain in plain text, then your post (and suggestions) will be kept there for people who may need the same kind of solution.

But google won't archive attachments and your pdf documents and web pages are probably temporary and won't get archived either. So those links/attachments won't help anyone who's searching later.

And I try not to open attachments or click on links to other stuff. Lots of bad stuff can happen and I'm not (usually) willing to take the risk--no matter how small.

That said, I clicked on your web link (bad Dave!).

It looks like your headers are in Row 4. And you want to insert between the last used column and the next to last used column.

I don't see how the numbered heading and adding 1 fits in.

But this might be closer to what you want.

Option Explicit
Sub testme01()

Dim myCol As Long

With ActiveSheet

myCol = .Cells(4, .Columns.Count).End(xlToLeft).Column - 1

If myCol = 1 Then

MsgBox "I can't copy from the left of this column!"

Exit Sub

End If

.Columns(myCol + 1).Insert

.Columns(myCol).Copy

.Columns(myCol + 1).PasteSpecial Paste:=xlPasteFormats, _
Operation:=xlNone, SkipBlanks:=False, Transpose:=False

```
.Cells(1, myCol + 1).Select  
End With
```

```
Application.CutCopyMode = False
```

End Sub

Notice that the myCol (I renamed it from LastCol to match the existing code) now uses:

```
.cells(4,.columns.count).end(xltoleft).column -1
```

That 4 means row 4.

the .columns.count means 256, the .end(xltoleft) is like going to IV4 and hitting End, then left arrow.

It'll take you to the last used cell in that row. Then I subtract to go back one more.

I dropped the stuff about adding 1 since I didn't see that in your page.

If this is wrong, please take the time to describe what you want in plain text.

(I don't like breaking my rules <vbg>.)
