-

I have 2 work sheets – sheet1 lists daily items i.e. entry date, no of entries, amount of entries etc (one day per row), sheet2 is a summary of the daily totals. I have been asked to produce a summary of the daily totals on a weekly basis. So on sheet1 we will have 5 rows, but on the summary sheet the 5 daily totals for (say) no. of entries will all be added together to give just one grand total for the week.

I have added a column on sheet1 to give me the week no., but now I want to put a formula on sheet2 that in simple English will say if on sheet1 the weekno = 26 then sum the no. of entries. In addition I want to be able to drag the formula down each week so the weekno. will automatically increase in line with the current week.

Could anybody help me with this please.

Bob
