I have never once recommend the usage of MDB files anywhere.

your access folk don't know what the hell they're doing.

anyone using mdb in 2006 is out of date; just like anyone using xls in 2006 is out of date.

it is all about this technology called 'Access Data Projects'

they are the best IDE anywhere in the world— for designing stored procedures and views.

sql server management studio has some things on it; but it's still too close ot call in my book.

I have never ever had an access data project that isn't lightning fast.

it keeps all the tables and views, and sprocs in one place.

- a) version control is a lot easier; since you're not copying client-side queries around
- b) stronger query engine
- c) parameterization
- d) user defined functions
- e) triggers

i think that it's an awesome friggin stack.

i mean— it's unbeatable anywhere.

data entry forms; reports— it's 10,000 times more powerful than xls.

im sorry you're too close minded to use modern tools.

xls is for babies.

i've got a better excel than you do; i've got better pivotTables than you do.

Re: why>?

give up kids

greaseman wrote:

And your point is, besides the one on your head?

This is apples and oranges, since Excel is a spreadsheet-type application and Access is a database application, and besides that, WHO CARES what you think?

".....sub-second response times against billions of records. " Really? How? I've worked in companies, large and small, where tons of records have crippled Access, as well as having several users hitting a database at the same time has also crippled Access.

Perhaps you do know both Excel and Access, but most of your responses and musings in this forum are a bit simpleton and extremely prejudiced. You sound like, "Nyaaaa, nyaaaa, I can do this better than you can!" That is only because as I said earlier, one is oriented toward spreadsheets and one is oriented toward database processing.

If you don't care for Excel, then don't use it and please find another newsgroup / forum to harass.
