I work at a production plant. We have 3 shifts.

I have a workbook to track production.

On the opening sheet of the workbook I would like each supervisor to input which shift (1, 2, or 3) they are inputting data for via drop down box. Then on the next sheet – and this is where I need guidance – how can I have the input from the 1st sheet (Shift Number) return a list (from another worksheet further back in the same workbook) via another dropdown box of the employees that are assigned to the returned shift?

In other words, if the supervisor selects "2" from a drop down box titled "Shift" on the first page how can I return a list of all the employees who are on second shift to another drop down box on the second worksheet in the workbook?

Lets call the workbook: ProductionBook.

The first page where the supervisor selects the date and shift number: OpeningPage.

The second page where I need the guidance we can call: ProductionInput.

Re: Return subset to drop down box

The page with the employees info: Employees

Thanks a bunch,

Tim
