We used to run software called Mailcheck (I believe by a company called ipswitch) It was one of those "red, yellow, green" light views of email. One set up an email account on a server and could bounce mail through just about anything – exchange, notes, smtp etc. We had all our email servers monitored and would be paged whenever delivery became an issue.

Well... as the years have gone by we've outgrown the software by about 20 servers, and its no longer supported (or we cannot purchase additional licenses etc.)

Aside from some full blown package like MOM etc. – does anyone know of a good system that can do similar email monitoring? I don't want all the extras like service monitoring. I know Exchange has built-in monitoring, but that isn't quite the same...

We want a system that can show our helpdesk where the problems are so they can get help as necessary.

We used to have a map of the world and had all our servers placed at all our locations. it was cool... wish they had continued upgrading and improving that product.
