Log on to your exchange server, start IIS, select the exchange folder under Default website. Select properties, Directory security. Click Edit under Authentication and access control. Under Authenticated access select your domain in both 'Default domain' and 'realm' – Click OK and OK... Voila!!!

Now its working correct again!!

>-----Original Message-----

>After upgrading my Exhcange Server 2003 with SP1, users are asked to logon in the following way in OWA: "doman\username".

>

>Before upgrading with SP1, users just had ti write "username". Since I only have one domain, there is no point in writing the domain in logon procedure. This change has given lots of trouble with the users, because they are not aware of this change. Also some users having problems finding the "\" on the keyboard!!

>

>Is there anyway I can change the logon back, so users only have to write "username" i OWA.
