Please help,

While I'm familiar with workstation setups but I'm a total newbie w/servers.
Please be kind-

I'm trying to set up MS SBS Exchange 2k3 as a mail server accessible via the internet. ISP connect via Verizon dsl thru Lynksys router. Unfortunately, I keep getting the following 2 errors after trying to install the Outlook 2k3 setup component:

(1) During Setup, the IP address of 192.168.0.2 for the network adapter used by Windows Small Business Server to access the local network was provided by an existing DHCP server. Ensure that this IP address is excluded from the DHCP scope. Additionally, you should configure your DHCP server using the information provided in Appendix C of the Getting Started guide.

(2) An error occurred while installing Windows SharePoint Services and creating your intranet site.

Can anyone help me resolve these issues?

Thanx,
pro36
