You can also try using SpamAssassin. Its free, but well supported and maintained.

You can install Perl on the Exchange servers and deploy SpamAssassin. Everything thats received on the SMTP can get filtered by SpamAssassin using this plugin: <http://www.christopherlewis.com/ExchangeSpamAssassin.htm> There is a very clear installation guide for Windows and when you follow it exactly, nothing can get wrong. I use it and it works very well.

It requires some effort for the bayes filter to get it working. SpamAssassin will auto-learn spam and ham, but it takes some time (200 samples of both are desired). You can do this manually too.

Slight backdraws on Exchange are that the user should have a rule in Outlook (or on the exchange server) to move the mail to the junk mail folder. Rules, settings and bayesian filtering applies to everyone.

McAfee SpamKiller has SpamAssasin integrated.
