Very odd problem this keeps appearing on a hand full of machines.

User can send msg's fine unless adding attachments (mainly microsoft based ones)

When user clicks attachment button, it goes straight to a select file dialog box rather than bring up the attachment dialog where the user would normally click browse.

After attaching via this method user cannot send msg as another dialog box appears with the following text.

"One or more errors occurred while the message was being sent.
Error: (0x80070005):Access is denied."

NOTE:This server is running SSL, the user is a domain user so no admin abilities.
