Great, thanks for the answer so fast.

One other question.

I shutdown the 5.5 server to test mail flow without the 5.5 server before I remove it and mail seemed to flow except for one problem. I was able to send email to the other administrative group but the user who has his mailbox on the E2k3 server would get undeliverables when replying to my email while the user with the mailbox on Exchange 5.5 was able to reply to me without any problems. I'm not sure where the problem is since it is happening between me and another E2k3 user. If I can send to them but they can't reply to me is it something with their routing or mine? And if so, where do I need to look or have them look besides the routing connectors for the possible problem.

I would think it would be something on their end since I can send to them and they receive it, but I may be wrong.

Thanks for the help.

Mike
