On a domain controller, go to Start/Administrative Tools/Active Directory Users and Computers.

On the left hand side, you can right click on the domain name, and it will give you the option to connect to a specific domain controller. Check several. For each one, once you're connected, browse to the user in question, and check Exchange General to see what server they're on, and you can also check Email Addresses to see if the user has been "stamped" by the Recipient Update Service. Check for consistency amongst all your servers.
