We recently put an intranet site on our IIS server that hosts OWA. The "webmaster" couldn't log in without putting in a password, and so played around with the permissions in IIS for the Default Web Server.

Now when users go to Outlook Web Access, they're prompted to put in their user name and RSA but when it gets to redirecting to the login screen, the page errors out, with a Page Not Found, Internet Information Services.

The IIS server was the only thing that's changed, and the RSA portion is working, so I'm sure its permissions that's causing the problem. Only thing, I don't know what permissions I should have.

ANY ideas would be greatly appreciated.

Thanks!

Doreen
