done a nice silly thing, accidentally changed the permissions on the administrator account to deny full access in the exchange organisation. i used the reg hack to access the security tab.

i know that's why it's hidden to prevent things like this, so please dont remind me ;)

thing is, although i can do most things from another admin account, i cant get access to that security tab, even with the reg hack for that user. so i cant undo the damage. is there any way or removing those permissions using another tool? i cant add the other amin account to the delegation wizard, it says cannot grant permision, probably because i'm not logged on as administrator, which i cant do since if i do i cant access the system manager!

any way round this?

.
