Thanks for your help so far Ben. Here is what I have now in my settings now that I read your post:

In Exchange Manager:

[Access] Tab

[Authentication] Button:

Anonymous=checked
Basic=unchecked
Integrated Windows Authentication=checked

[Relay] Button:

Only the list below=checked
Allow all computers that successfully authenticate...=checked

No other changes have been made. Do I need to do something under the [Delivery] tab?

Stop and start SMTP. Do I need to stop and restart any other services?

In Outlook I enabled SPA checkbox, and did a "Test Account Settings" that came back with a dialog asking for username, password, & domain (not just username and password).

I put in internal domain (fqdn) user and password, but it kept popping up. I finally clicked [Cancel] and it returned an error message in Outlook stating: "The POP3 email account you created does not support SPA..."

Do I need to do something with POP3 Virtual Server?

Thank you in advance for your help.

-Harry
