Hi Ed,

I realise I didn't make that very clear. I believe that Lotus Notes can house documents and other group-ware data in databases and I wanted to know if you can access those without using the Notes client. I understand that you need the client on the Exchange server to assist the Notes Connector. But from what I have seen, that will only synchronise Directory, email, and calendar data. What about public folders, Notes DBs, etc.?

And my second question regarding the GAL. Ho do you make sure that the account information imported from the Notes data is not included in the GAL? I am having some trouble creating an Address List for the container that will house the accounts imported from Notes. This is what I have:

```
(&(objectCategory=contact)(objectCategory=organizationalUnit)(ou=Notes)(mail=*))
```

Any help would be greatly appreciated.

Thank you,

Jarryd
