Authenticated Users is likely the problem. It's a built-in group (NTAuthority\Authenticated Users). I have no idea how it got there – it isn't usually there by default. You should be able to safely remove it – at the very least, remove the Send As/Receive As permissions. Once you do that, see if the problem resolves itself.

Sorry about the wrong KB – must have not copied to clipboard correctly. Here's the right one.
